

depth saturation

second hierarchy: $H = 4$

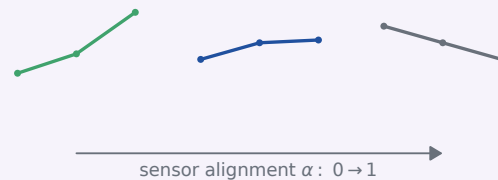

task family $\times$ alignment

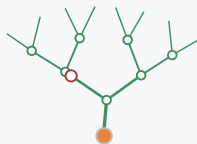

nested factors

flat factors

local ratios

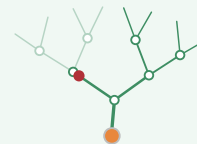

matched additive control

same local operating point

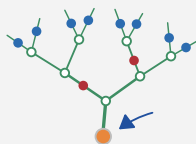

focal shunting conductance

descendant transport changes selectively

conductance edits G , and therefore $q = G^{-T} \nabla_V \mathcal{L}$

measured responses

no morphology-specific alignment

imposed alignment

same dictionary, task field rotated

learning and animal tests

sufficiency versus endogenous use

availability $\rightarrow$ controlled sufficiency $\rightarrow$ evidence for endogenous use

stochastic credit

$\hat{g}$

route operator

M

routed update

$M\hat{g}$

retained task signal

versus

representation error + admitted noise
