

A

Eligibility $\times$ delivered credit

directed conductance tree

$$\Delta g_i = -\eta e_i \varepsilon_n$$

$$e_i = x_i R_n (E_i - V_n)$$

local eligibility

$$\varepsilon_n = \alpha_3 \alpha_2 \alpha_1 \delta_0$$

delivered error

gain: how strongly along the route?

B

One tree, three dictionaries

Delivered field = $A c$

12 sites
+ soma

K = 1

K = 3

K = 12

K = 1 and 3: oracle projection

Rows: sites grouped by subtree; columns: profiles

C

MNIST: ten paired seeds at independently selected rates

**D**

Additional within-tree resolution

**E**
